

P Planetary Gearbox

Modified date 04/2021

P Series Planetary Gearbox

- » The sun wheel and planetary wheel are made of high quality quenching alloy steel, the ring gears adopt in hardened surface alloy steel, all grinding gears.
- » Cast iron housing and steel/cast iron frame, all designed by computer simulation and stress analysis method, which will enlarge the loading capacity.
- » Highly modular design makes all the spare parts standardization and reducing the stock. Improve delivery speed.
- » All bearings using roller bearings, the force part are import brand bearing.
- » The input and output side with radial skeleton seal, wherein the output double seals.
- » Lots of accessories for choose and can be used with other products of our company.

P

Steps	Description	Symbols	Parameters Calculation and Guidelines																			
1	Driven Machine Factor	f1	Refer to f1 table on P8 and P9.																			
2	Prime Mover Factor	f2	Prime Mover Factor						f2													
			Electric motor, hydraulic motor, turbine						1.0													
			Piston engine with 4-6 cylinders, cyclic variation 1:100 to 1:200						1.25													
			Piston engine with 1-3 cylinders, cyclic variation 1:100						1.5													
3	Factor for gearbox reliability	SF	Refer to SF table on Page P9.																			
4	Input Speed	n1	$\leq 1500 \text{ r/min}$ Consult us if higher speed required.																			
5	Calculation of the ratio	i	$i = n_1 / n_2$																			
6	Determination of gearbox type and transmission efficiency	η	Type	η	Type	η																
			P2N..	94%	P3N..	92%																
			P2L..	93%	P3S..	91%																
			P2S..	93%	P3K..	89%																
			P2K..	91%																		
7	Calculation of the input power of the gearbox on basis of the torque and power required by the driven machine.	P1	$P_1 = T_2 \cdot n_1 / (9550 \cdot i \cdot \eta)$ or $P_1 = P_2 / \eta$																			
8	Determination of gearbox size referring to the table of Transmission Capacity.	T2N P1N	$T_2 N \geq T_2 f_1 f_2 S_F$ or $P_1 N \geq P_1 f_1 f_2 S_F$ If $3.33 \cdot P_1 \geq P_1 N$ is not met, Please consult us.																			
9	Check Peak Torque	TA	$P_1 N \geq T_A \cdot n_1 \cdot f_3 / 9550$	f3			Load peaks per hour															
				Steady direction of load		0.5	0.65	0.7	0.85													
				Alternating direction of load		0.7	0.95	1.10	1.25													
10	Check the radial on the shafts.	Fr2	See Fr2 table on P29.																			
11	Calculation of the utilization	f14	Utilization $= P_1 / P_1 N \cdot 100\%$ f14: factor for utilization	Utilization	30%	40%	50%	60%	70%	80%												
				f14	0.66	0.77	0.83	0.90	0.90	0.95												
12	Ambient temperature factor	ft	Refer to ft table on Page 8.																			
13	Check thermal capacity	PG	P1 ≤ PG = PG1 · ft · f14 no cooling device is required. if $P_1 > PG$, auxiliary cooling device should be installed. Consult us if required.																			
14	Determination of lubrication system		For details about lubrication system, see P54,55.																			
15	Determination of every item included in the Type Designation		For details about Type Designation, see p1.																			

Peak torque: max. load torque, which means max. torque due to be caused from starting, braking or max. pulsating load. (Generally, it refers to peak starting or braking torque.)

Example

Prime mover

Motor Power : 90kW

Motor Speed: $n_1=1000\text{r/min}$

Max. starting torque: 2000N.m

(This value is usually provided by users. If not available, it is routine to calculate by 1.6 times of nominal torque of electric motor.)

Driven machine

Name : bucket conveyor

Speed: 12.5r/min

Output torque: 68000N ·m

Duty: 12h/d

Starts per hour: >3 times

Operating cycle per hour: 60%

Ambient temperature: 20°C

Place of installation: in the open

Altitude: below 1000m

Gear Unit

Parallel input shafts, solid output shaft with parallel keys, input shaft facing downwards, mounting position B53

Selection steps:

1. Determination of gearbox type:

1.1 Calculation of the ratio: $i=n_1/n_2=1000/12.5=80$

1.2 Selection of gearbox type:

P2SB..-B53 selected(as per the ratio, input and output shafts).

2. Determination of gearbox size:

2.1 Calculation of the nominal power of gearbox:

$$P_1=T_2 \cdot n_1 / (9550 \cdot i \cdot \eta)$$

In the table of transmission capacity on P5, $\eta=0.93$

$$P_1=T_2 \cdot n_1 / (9550 \cdot i \cdot \eta)$$

$$=68000 \times 1000 / (9550 \times 80 \times 0.93) = 95.7 \text{kW}$$

$$P_{1N} \geq P_1 \times f_1 \times f_2 \times SF$$

See P7, $f_1=1.5$, and P5 $f_2=1$ P8, SF=1

$$P_{1N} \geq P_1 \times f_1 \times f_2 = 95.7 \times 1.5 \times 1 \times 1 = 143.6 \text{kW}$$

Selected from the table of transmission capacity: P2SB14-80-B53,

where $P_{1N}=149 \text{kW}$ iex=78.8

2.2 Check

$$3.33 \times 95.7 = 318.681 \geq P_{1N}, \text{satisfied.}$$

2.3 Check of peak torque

$$P_{1N}=149 \text{kW} \geq TA \cdot n_1 \cdot f_3 / 9550$$

$$=2000 \times 1000 \times 0.5 / 9550 = 104.71 \text{kW}, \text{satisfied.}$$

3. Check of thermal capacity

$$\text{Nominal power utilization} = P_1 / P_{1N} = 95.7 / 149 = 0.642 = 64.2\%$$

So $f_{14}=0.9$ ft=1.16

$$P_{G1} \times f_1 \times f_{14} = 94 \times 1.16 \times 0.9 = 100.32 \text{kW} > P_1$$

So no auxiliary cooling device is needed

Lubrication: Dip

4. The type selected:

P2SB14-80-B53

1. Determination of nominal power of driven machine

*) The normal power usually corresponds to max. torque

**) The actual service factors should comply with the actually classified loads. For more details, please consult us.

***) A check for thermal capacity is absolutely necessary.

2. The factors listed above are empirical values only. Prerequisite for their applications is that the machinery and equipment correspond to generally accepted design and load specifications. In case of deviations, please consult us.

3. For driven machines not listed in the table, please consult us.

Factor for gearbox reliability			SF
Ordinary: single machine halts when gearbox fail, easy to replace spare parts and minor loss occurred.			1.0≤SF≤1.3
Important: a product line or an entire plant halts when gearbox fail, heavy loss.			1.3<SF≤1.5
Highly reliable: severe production problem happens when gearbox fail, enormous loss and life injuries.			1.5<SF

Thermal Factor						ft

Note:

(1) the power of the coupled motor in selection must be sufficient for the transmission capacity requirements; the flanges listed in the table are standard. Consult us if any deviation exists.

(2) For combinations with torque arm on one side, please consult us.

25-36	On request						

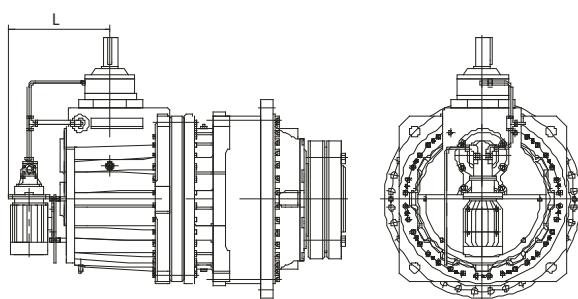

In case of vertical mounting position, normal lubrication system would fail to feed the overhead rolling bearings. To ensure an adequate supply of lubricants, the oil level has to be increased accordingly. As shown above (D1, D2), an oil compensating tank with breather is attached for this purpose. It can be fitted either to the gearbox or to the customer's machine frame. The actual dimension and final position will be decided when the product is ordered.

Forced lubrication with motor pump(accessory code S32)

Note: For mounting positions, see P4.

11.9.3 Planetary gearbox in other mounting positions are usually lubricated with splash lubrication system

Note: Verify the thermal capacity of the gearbox when selecting the lubrication systems, especially the mode of oil compensating tank.

290 < d ≤ 330	70	36	22	d + 14.4
330 < d ≤ 380	80	40	25	d + 15.4
380 < d ≤ 440	90	45	28	d + 17.4
440 < d ≤ 500	100	50	31	d + 19.5
500 < d ≤ 560	110	56	34.3	d + 22.2
560 < d ≤ 640	120	63	39	d + 24.5

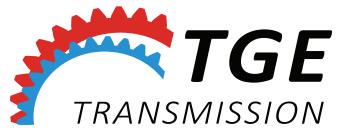

Note:

- The structure scheme, appearance diagram and other attached diagrams in sample are examples, there is no strict proportion requirement. (The unmarked dimension units are mm).
- The marked weight is average value, it has no constraint force.

 You must conform to the following instructions:

- To prevent accidents, all the rotation parts are added with protective covers according to the safety regulations of the nation and region.
- Before debugging, you should carefully read instruction book.
- Gearbox is on running-permission status when delivered, you should add lubrication oil before putting it into running.
- The marked oil quantity in sample is only reference value, actual oil filling quantity should be the same with the mark on oil immersion lens.
- Lubrication oil viscosity should be selected according to working situation and application environment temperature of gearmotor.
- You can only apply lubrication oil of internationally famous brand.
